                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition containing antagonist of growth factor GP88 - useful for treating cancer and viral diseases and also for diagnosing disease from altered GP88 expression
                                                                                                                                                          TGFe is a glycoprotein with an Mr of about 25,000. The partial amino acid sequence of purified bovine TGFe indicated no homology to other known growth factors. However the N-terminal sequence exhibits considerable amino acid sequence identity to the deduced N-terminal amino acid sequence of human granulin A and the N-terminus

A patient with a form of chronic myelogenous leukemia underwent two treatments of cytophoresis from which basophils were recovered. These were used to search for novel basophil granule proteins (BGP). The proteins were fractioned. Ca. 25 peaks were identified. Several fractions were pure enough to allow for the determination of a single amino acid sequence. The N-terminal sequences of eight
                                                                                                                                                                                                                               Antagonists to
This is the amino acid sequence of peptide A14R, comprising amino acid residues A566-R579 of human GPB8 (see AAM56475). GPB8 is an 8 kpa ajvoprotein autocrine growth factor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently required growth stimulator for the tumorigenic cells. Al4R was used in an attempt to raise neutralising antibodies to GPB8 (see also AAW5480). Antagonists GPB8, such as anti-GPBB antibodies, are used to treat diseases associated with increased expression of GPB8, particularly cancer but also viral infections. Anti-GPB8 antibodies can also be used
                                                                                                                                                                                                                                                                                                                                    but also viral infections. Anti-GP88 antibodies can also be used as diagnostic reagents and to deliver toxins or other compounds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New basophil granule proteins obtd. from cytoplasmic granules for diagnosis and treatment of pathologies involving inflammatory and IgE-mediated responses, infection, hypersensitivity and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR51665 shows an N-terminal sequence of a basophil granule protein. The BGP can be extracted from human basophil granules by treatment at pH 9.0 or greater. This can be used to generate its corresponding nucleic acid an antibodies. Anti-BGPs are useful for the diagnosis of prepathologic conditions as well as chronic and acute diseases, such as parasitic infection and leukaemia, where there is a change in the amount or distribution of BGPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human basophil granule proteins - and related nucleic acid, expression systems, antibodies, etc., for diagnosis and treatment of e.g. inflammation, parasitic infection, leukaemia etc.
such fractions are represented in AAR20736-42 and AAR22455.

Porphyromonas gingivalis; protective epitope; antiinflammatory; vaccine;
                                  TGFe is a glycoprotein with an Mr of about 25,000. The partial amino acid sequence of purified bovine TGFe indicated no homology to other known growth factors. However the N-terminal sequence exhibits considerable amino acid sequence identity to the deduced N-terminal amino acid sequence of human granulin A and the N-terminus

The present sequence is one of twenty overlapping peptides corresponding to the N-terminal 148 residues of the PrER27 adhesin from Porphyromonas of the N-terminal 148 residues of the PrER27 adhesin from Porphyromonas gingivalis. Antibodies directed towards the PrEZ7 adhesin were found to provide protection against periodontitis in a human patient and immunoprotected mice. The peptides comprising at least one P. gingivalis epitope periodontesin. Peptides comprising at least one P. gingivalis epitope are useful in the treatment and prevention of periodontal disease, particularly periodontitis, which is associated with P. gingivalis infection. The peptides are useful as immunosens in vaccine formulations infection. The peptides are useful as immunosens in vaccine formulations for active immunisation. They may also be used to generate protecting and peptide-specific antiserum useful for passive immunisation, and to generate polycional or monoclonal antibodies. The immunisation and antibodies against the peptides can be used in diagnostic tests to detect P. gingivalis infection. The antibodies can also be used in oral compositions such as toothpaste and mouthwash to neutralise the

This is the amino acid sequence of peptide S14R, comprising amino acid residues S562-R575 of murine GP88 (see AAW85474). GP88 is an 88 kDa glycoprotein autocrine growth factor that is expressed in a tightly regulated manner in normal cells, is overexpressed and unregulated in highly tumorigenic cells derived from normal cells, and which acts as a stringently regulated growth stimulator for the tumorigenic cells. S14R was used to raise neutralising antibodies to GP88. Antagonists to GP88, auch as anti-GP88 antibodies, are used to treat diseases associated with increased expression of GP88, particularly cancer but also viral infections. Anti-GP88 antibodies can also be used as diagnostic reagents and to deliver

The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoletin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that make prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms.
                                                                                                                                                                                                                                                             Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autolmmune diseases and infections -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             platelet derived growth factor; PDGF; smooth muscle; mimic; interaction site; constrained conformation; inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PDGF inhibitor (PGF-3), contg. proline brackets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conservative:

                                                                                                                                                                                                                                                                                                                            Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFs and APIs correlates with the severity of Alzheimer's Disease. The present sequence is a peptide produced from an API by proteolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFs) and Alzheimer's Disease-Associated Protein Isoforms (AFIs) in cerebrospinal fluid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       serum or plasma. The abundance of the AFs and APIs is then normalised to an Expression Reference Protein Isoform (ERPI) in

```
Peptides with affinity to human TSH (thyroid stimulating hormone) receptor antibody are used for detection of the antibody: (See also AAR73201-592).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           To obtain a poliovirus-1 (PV1)/Chlamydial hybrid, the PV1 Mahoney CDNA clone PT/XLD was modified to encode epitopes from C. trachomatis ser. A MOMP VDI. The VOI sequence was not restricted to the known epitope given in AAR66356, or to the sequence given in AAR66383 (expressed in previously described hybrids), but instead included adjacent sequences from VDI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New hybrid picornaviruses expressing chlamydial epitopes to develop prods. for vaccination, diagnosis, treatment of chlamydial infections and prodn. are deriv. from PDGF peptides that contain proline or proline/cysteine brackets. These peptides that contain proline or proline/cysteine brackets. These peptides contain one or more interaction sites of interest. The dose is 5.5000 microcomoles. The peptides interact with specific receptors and inhibit the migration of macrophages, and thus inhibits the pro-inflammatory effects of the interleukin. The data collected demonstrates that interaction sites possess activity when present in a polypeptide that differs from the native form. Inclusion of conformation-constraining moleties can have desirable effects on an interaction site. (Also see AAR67011-117 and AAR67121-52 for analogues of other biologically active peptides conformation interaction site flanked
                                                                                                                                                                Peptide homologue or analogue with constrained conformation - has proline residues flanking the interaction site to impart greater, or more stable, biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptide(s) having affinity for the human TSH receptor antibody - used in detection of the TSH antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    thyroid stimulating hormone receptor; TSH; human; Homo sapiens; antibody; affinity; detection.

The peptides used in the composition comprise sequences of human oestrogen receptor (OR) surrounding Tyr537 and steroid receptor co-activator-1 (SCR-1). The peptide compositions, nucleic acids and vectors of the present invention can reduce OR activity in a cell, reduced OR polypeptide dimerisation in a cell and reduce the binding of SRC-1 polypeptide to an OR polypeptide dimer in a cell. They can be used for killing cancer cells and treating cancers, particularly breast cancer. The present sequence represents a specifically claimed anti-oestrogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New anti-oestrogen peptide compositions - comprise sequences based on oestrogen receptor and steroid receptor co-activator-1 sequences, used for treating cancers

Nuclear hormone receptor drug screens

```
binding reaction occurs in solution. The sensor peptide obviates the need to include a natural coactivator protein of the receptor in the mixture. Sequences AAVI3571-587 represent examples of sensor peptides that can be used in the method of the invention.
                                                                            hormone receptor function. The methods use a sensor peptide covalently coupled to a detectable label, that provides direct, in vitro ligand-dependent binding to a nuclear hormone receptor. Panels of predetermined or randomized candidate sensors are readily screened for receptor binding. The methods and compositions provide for efficient screening of modulators of nuclear hormone receptor function, without the use of cell- or gel-based steps. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for
                                                                                                                                                                                                                                                                                                 bloactive compounds. To ensure specificity and optimize binding, the sensor is generally present at sub-micromolar concentration and the
                                                        The invention provides methods for screening of modulators of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        890000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conservative:

subunit L17 identified and characterised using a novel method of the invention. The invention comprises a method for labeling a protein by protecting epsilon-amino groups of Lys, cleaving the protein by protecting epsilon-amino groups of Lys, cleaving the protein to produce a mixture of peptides and treating these with a labeling agent that binds to the N-terminal amino acid. The method is used for identifying proteins, e.g. for analysis of proteins expressed by cells in different expression states. The method makes possible relative protein esparation in one- or two-dimensional gel separations, even when separation is only partial, and facilitates de novo sequencing and automated interpretation of mass spectra. Protection of Lys sidechains ensures specific labeling of the N-termini, increases the intensity of the bings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Method for labeling proteins, useful for identification, particularly in expression analysis, by blocking lysine sidechains, proteclysis and N-terminal labeling of peptide fragments

b-ions (permitting full-length sequence coverage for peptides of m/z over 1000) and allows differentiation between Lys and Glu. The use of different isotopic labels allows different proteins in the same gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vascular endothelial growth factor receptor-2 peptide modulator #121

modulator of VEGF function. The compound is useful for: treating a pattent suffering from poorlasts, rheumatoid arthritis, retinopathy and cancer; for imaging and assessing neovascularisation during anglogenesis; for detecting VEGFR-2 receptor or related receptor on living cells, as a calibration standard for quantitating the activities of candidate VEGFR-2 screening; as blocking reagent in random peptide screening i.e. in screening for new families of VEGFR-2 peptide ligands; in the co-crystallisation with VEGFR-2; in inhibiting or decreasing the proliferation and growth of vascular endothelial cell growth factor dependent cell lines e.g. human umbilical vein endothelial cells (HUVEC) and other research and disposite applications where VEGFR-2 is

The epitopes AAR82098 AAR821098 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+ cTLs in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW42528
```

```
This sequence is shown in the specification. The invention relates to peptides, which are immunogenic with lymphocytes directed against metastatic melanomas. They are characterised in that they comprise at least a part of the following sequence, where the amino acid at position 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gly-Val. Vaccines comprising the peptide, an epitope of the peptide, nuclectide sequence encoding the peptide, or a antigen presenting cell preloaded with the peptide or antibody as above, are useful for cancer, particularly melanoma, treatment. The peptides can also be used to generate antigen reactive tumour infiltrating lymphocytes, which can also be used in reactive tumour infiltrating lymphocytes, which can also be used in reactive trace of the peptides can be exploited to elicit native epitope-reactive CTL. Usage of the peptides with improved immunogenicity may contribute to the development of CTL-epitope based vaccines in viral disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying agonists or antagonists for ligand-induced activation of
                                                                                    associated peptide analogues - useful in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oestrogen receptor beta; ER-beta; MBP; binding; detection;

The present invention describes the use of a ligand binding domain (LBD) transcription factor (TRX) fusion protein in methods for identifying transcription factor (TRX) fusion protein in methods for identifying cranscription factor ligand-induced activation of a predetermined conclear receptor having a LBD. Also describes are: (1) a positive hybrid nuclear receptor signal transduction system, comprising an ideact comprising an ideact comprising a reverse hybrid reporter host cell; (3) a multipliexed format comprising a reverse hybrid reporter host cell; (3) a multipliexed format confider pharmaceutical agent from a library of test agents; (5) a candidate pharmaceutical agent from a library of test agents; (5) a confider pharmaceutical agent from a library of test agents; (5) a confider pharmaceutical agent from a library of test agents; (5) a confider pharmaceutical agent from a library of test agents; (5) a confider pharmaceutical agent from a library of test agents; (5) a confider pharmaceutical above methods are nuclear receptor, typically by interaction with a binding contring to ancelear receptor identified using above methods. The new methods are useful for identified using above methods. The new methods are cuseful for identified using above methods are lasting agonts to ligand-induced activation of a predetermined nuclear receptor having a LBD. The present sequence represents a coactivation lear invention in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; fung cancer; metastasis; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy;
predetermined nuclear receptor having ligand binding domain (LBD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human cancer antigen NY ESO-1/CAG-3 HLA peptide motif.

   This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 ORF1 (see AAX5859). 30 Epitopes (see AAX60814-47) were identified.

The present peptide (ranked 14) corresponds to amino acid residues 153-160 of CAG-1 ORF1 (see AAX05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAX05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer: cracked administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived concers such as primary or metastatic melanoma, thymoma, Imphoma, sarcoma, lung cancer, liver cancer, leuksemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocariomas such as breast, prostate, ovarian, pancreatic and

screen for epitopes from the coding region of human ESO-1/CAG-3
C ORF1 (see AAX5659). 30 Epitopes (see AAX0618-47) were identified.
The present peptide (ranked 22) corresponds to amino acid residues
152-160 of CAG-1 ORF1 (see AAX05965). CAG-1 is a new and potent
tumour antigen capable of eliciting an antigen specific immune
response by T cells. Cancer peptides (see AAX05967-87) derived from
CAG-3, portions of CAG-3 and their variants, are useful as cancer
c vaccines. A claimed method of preventing or inhibiting cancer
involves administering a cancer peptide, with or without an HLA
molecule. The cancer peptides form part of, or are derived
from, cancers such as primary or metastatic melanoma, thymoma,
Iymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine
cancer, cervical cancer, bladder cancer, leukaemia, uterine
cancer, cervical cancer, bladder cancer, kidney cancer and
adenocarcinomas such as breast, prostate, ovarian, pancreatic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NY ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human; leukaemia; non-Hodgkins lymphona; Hodgkins lymphona; lung cancer; metastasis; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; errical cancer; cancer; tuding cancer; tuding cancer; tuding cancer; cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy; vaccine; human leukocyte antigen; HLA.
                                                            This peptide was identified as an HLA peptide motif following a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human cancer antigen NY ESO-1/CAG-3 HLA peptide motif.

modulators of nuclear hormone receptor function, without the use of cell- or gel-based steps. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for bioactive compounds. To ensure specificity and optimize binding, the sensor is generally present at sub-micromolar concentration and the binding reaction occurs in solution. The sensor peptide obviates the need to include a natural coactivator protein of the receptor in the mixture. Sequences AR13571-587 represent examples of sensor peptides that can be used in the method of the invention.

Sequence

binding. The methods and compositions provide for efficient screening of

Nuclear hormone receptor; sensor peptide; receptor binding; screening; This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 ORF1 (see AAX58599). 30 Epitopes (see AAV06018-47) were identified. The present peptide (ranked 8) corresponds to amino acid residues 154-162 of CAG-1 ORF1 (see AAY05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAY05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptides, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and 00000 Conservative: Mismatches: Indels: Length: Matches: Gaps: (1-9)AAY13578 standard; peptide; 9 AA. 1119 CAGCAGCTGTCCCTCCTC 1136 US-09-824-647-16 (1-2095) x AAY06025 GlnGlnLeuSerLeuLeu 6 98US-0163713. 97US-0975614. .94e+07 .00 98WO-US24969 100.00% 100.00% 0.86% 30-JUL-1999 (first entry) Peptide sensor IUK-1472 Best Local Similarity: Query Match: Sequence 9 AA; thyroid cancers. The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of antigen in the lymphatic system of a mammal so as to provide a sustained CTL response, used to treat, e.g. AIDS

disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or ADDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milleu of the lymphoid organ, and it sustains stimulation that takes that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAV10071 to AAV1063 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cancer testis tumour antigen; NY-ESO-1; LAGE-2; human leukocyte antigen; HLA; HLA binding peptide; major histocompatibility complex; MHC; tumour; cancer; testis tumour.

individual that comprises determining the ratio of phospho-tau (181)/
total tau. Tau and phospho tau are useful as neurological markers for the
manufacture of a diagnostic kit for the diagnosis of a tauopathy and/or
the differential diagnosis of a tauopathy versus a non tauopathy. A
phospho-peptide liable to form an immunological complex with monoclonal
antibody HT7 and MAD AT270 comprising at least the minimal epitope of HT7
or AT270 is useful to measure phospho-tau levels and diagnose a tauopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           phosphopeptide kits and methods are useful for therapeutic monitoring and for determining the effectiveness of a treatment. Sequences AAB85641-64 represent synthetic peptides immunoreactive to tau antibodies HT7, taul,
                                                                                                                                                                                                                                                                                                                                                                                                                                               Tauopathy; phospho-tau (181); neurological marker; antibody; BT2; AT120;
BT7; AT270; nootropic; neuroprotective; cerobroprotective; epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and/or for the differential diagnosis of a tauopathy versus a non
tauopathy. The kit is useful for the diagnosis of Alzheimer's disease,
Pick's disease, sporadic Frontotemporal dementia and/or Frontotemporal
dementia with Parkinsonism linked to chromosome 17, Creutzfeldt Jacob
disease, stroke and/or neurotoxicity in patients with leukemia. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining the ratio of phospho-tau / total tau is useful for diagnosing a tauopathy i.e. Alzheimer's disease or Pick's disease, versus a non tauopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a method of diagnosis of tauopathies in an

bind to human leukcyte antigens (HLAs). NY-ESO-1 is a molecule that is processed to at least one human leukocyte antigen (HLA) binding peptide, which binds to Class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of cancer, especially testis tumours.

Alignment Scores:

Sequence

AAG67169-AAG67206 represent peptides which are derived from cancer testis tumour antigen NY-ESO-1 (also called LAGE-2). The peptides

The invention provides a method of diagnosis of tauopathles in an individual that comprises determining the ratio of phospho-tau (181)/
c total tau. Tau and phospho tau are useful as neurological markers for the diagnostic kit for the diagnosis of a tauopathy and/or the differential diagnosis of a tauopathy versus a non tauopathy and/or phospho-peptide liable to form an immunological complex with monoclonal contibody HT7 and MAD AT270 comprising at least the minimal epitope of HT7 or AT270 is useful to measure phospho-tau levels and diagnose a tauopathy cand/or for the differential diagnosis of a tauopathy versus a non tauopathy. The kit is useful for the diagnosis of Alzheimer's disease, pick's disease, sporadic Frontotemporal dementia and/or Frontotemporal dementia and/or prototemporal dementia with Parkinsonism linked to chromosome 17, Creutzfeldt Jacob disease, stroke and/or neurotoxicity in patients with leukemia. The phosphopeptide kits and methods are useful for therapeutic monitoring and for determining the effectiveness of a treatment. Sequences ABBS661.64

AAU02225-AAU02384 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HLA A0201, HLA A0205, HLA A1, HLA A24, HLA B27, HLA B2702, and HLA B40203. Tumour antigen derived gene-16 protein, TADG-16 (AAU02223), is a novel human extracellular serine protease. TADG-16 (AAU02223), is a novel human conserved catalytic triad, His-Asp-Ser, and a signal secretion sequence characteristic of the serine protease family. An antisense oligonucleotide having a complementary sequence to the TADG-16 nucleic acid is useful for treating various cancers, including ovarian, breast, antibodies specific to TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 are useful for the diagnosis of cancer.
                                                                                                                                                                                                                                                                                              Human; extracellular serine protease; tumour antigen derived gene-16; TAMG-16; ovarian carcinoma; breast cancer; lung cancer; colon cancer; prostate cancer; HLA type.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New tumour antigen-derived gene-16 protein, useful for diagnosis and treatment of ovarian, breast, lung, colon and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     660000

The TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 are useful for the diagnosis of cancer. TADG-16 protein or tast fragments are useful for vaccinating an individual against TADG-16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AMU0225-AAU02384 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HLA A0201, HLA A0205, HLA A1, HLA A24, HLA B7, HLA B2702, and HLA B4403. Tumour antigen derived gene-16 protein, TADG-16 (AAV02223), is a novel human extracellular serine protease. TADG-16 is expressed in normal ovaries and testes and in certain ovarian carcinomas. TADG-16 contains the conserved catalytic triad, His-Asp-Ser, and a signal secretion sequence characteristic of the serine protease family. An antisense

oligonucleotide having a complementary sequence to the TADG-16 nucleic acid is useful for treating various cancers, including ovarian, breast, lung, colon and prostate. The TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 are useful for the diagnosis of cancer. TADG-16 protein or its fragments are useful for vaccinating an individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAU02225-AAU02384 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HiA A0201, HIA A0205, HIA A1, HIA A24, HIA B7, HIA B8, HIA B2702, and HIA B4403. Tummour antigen derived gene-16 protein, TADG-16 (AAU02223), is a novel human extracellular serine protease. TADG-16 is expressed in normal ovaries and testes and in certain ovarian carcinomas. TADG-16 contains the conserved catalytic triad, HIS-ASP-Ser, and a signal secretion sequence characteristic of the serine protease family. An antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is given in a specification relating to a method for determining the status of a cancerous condition in a patient with a tumour that expresses NV-ESO-1. The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained between the values is indicative of a change in status of the cancerous condition. The method is useful for determining whether a cancerous condition is progressing, remaining stable, in particular in patients receiving treatment for a melanoma, adenocarcinoma, non-small cell lung carcinoma or bladder carcinoma.
                                                                                                                                                                                                                                                                                                                                                         Method useful for determining the status (e.g. progression, regression or stability of the disease) of a cancerous condition, involves determining the levels of NY-ESO-1 specific antibodies in a sample
 Human; NY-ESO-1; HLA; human leukocyte antigen; CTL; cytotoxic T cell; HLA-A2; HLA-DR53; melanoma; adenocarcinoma; bladder carcinoma; non-small cell lung carcinoma; tumour status determination.

The invention describes a composition comprising an immunogenic peptide having a human leucocyte antigen (HLA)-A2.1 binding site. The peptides bind specifically to HLA-A2.1, to cause T cell activation and thus a cytotoxic T cell response. The peptides and the nucleic acids that encodes them, are used, in vivo or ex vivo, for treatment of viral infections (hepatitis B or C; Epstein-Barr; human immune deficiency; taxposi sarcoma; human papilloma; Lassa fever or cytomegaloviruses); tumours including prostate cancer, renal carcinoma and lymphona (where directed to prostate ancer, renal carcinoma and lymphona (where or melanoma antigene); infection by Mycobacterium tuberculosis or protozoa (directed to trypanosome surface antigen); and condlyloma accuminatum. The peptides are suitable for use in peptide based
cytomegalovirus; tumour; prostate cancer; renal carcinoma; lymphona; prostate-specific antigen; p53; carcino-embryonal antigen; melanoma antigen; Mycobacterium tuberculosis; protozoa; trypanosome surface antigen; condlyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic peptide with human leucocyte antigen-A2.1 binding site, useful for treating e.g. viral infection or tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  vaccines. This sequence represents an immunogenic peptide with the human leucocyte antigen (HIA)-A2.1 binding site, described in the
                                                                                                                                                                                  Æ.

The sequences given in AAR93272-342 represent peptides which are SH3
ligands/SH3 binding agents. They represent a biased phage library
which comprises ix random amino acids flanking the tetrapeptide
- PPIP which was identified as a recognition sequence for the src SH3
domain. These sequences were identified using the method of the
invention. The method comprises contacting the SH3 domain with a
mixture of peptides under conditions permitting a ligand to bind to
an SH3 domain to form a complex. Any unbound peptides are removed
an SH3 domain to form a complex. Any unbound peptides are removed
an SH3 domain and then candidates which bind to the SH3 domain are
SH3 domain and then candidates which bind to the SH3 domain are
detected. The isolated SH3 binding peptides may be used in the
dagnosis, prevention and treatment of conditions or diseases resulting
from cellular processes mediated by an SH3-based interaction. Such
diseases include Paget's disease. Other conditions treatable with these
peptides include restenosis, rheumatoid arthritis, gout and other
problems in which an SH3 of neutrophil oxidase P47 and p67 complex is
                                                                                                                                                                                                                                                                                           Identification of peptide(s) binding specifically to SH3 domains for use in inhibiting interactions mediated by SH3 domains in treatment of e.g. osteoporosis and cancer

                                                                                                                                                                                                                                       Mahoney CDNA clone PTXID was modified to encode epitopes from C. trachomatis ser. A MOMP VDI. The mutagenesis cartridge was contained between PV nucleotides 273-91 (given in AAQ79003) which encode PV amino acids 1022-1104 (AAR66375) which include the BC loop of capsid protein VPI (AAR66386). The pollo-specific DNA within the cartridge, encoding the sequence given in AAR66369, was replaced by oligonucleotides encoding VDI peptides AAR66370-74. Viable PV vero cells.

The present sequence represents a consensus sequence obtained after several rounds of selection and amplification of a 6-mer peptide library. The consensus sequence is derived from peptide ligands of a D-enantiomer of interleukin-8 (IL-8), and was obtained using the method of the carget molecule, and comprises contacting a screening molecule with a variegated compround library, where the screening molecule with a target molecule, or the enantiomer if the target molecule as chiral. Compounds which have a desired interaction with the target molecule is called interaction with the target molecule are selected, and the ability of their enantiomer to interact with the target compounds which have a desired interaction with the target protein (a D-target protein), and a combining a D-panationer of a target protein (a D-target protein), and a variegated compound library, and then selecting one or more compounds to the library which have a desired binding interaction with the carget protein. The methods can be used for identifying agonists or at an analysis of target protein one with the carget protein. The methods can be used for identifying agonists or an analysis of target protein. The methods converse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antagonists of targets such as receptors, enzymes, DNA binding proteins or signal transduction proteins. The methods can provide a structurally selective approach in addition to scoring for interaction of functional groups. They provide a powerful selection method that allows for the production of ligands with the same diversity as peptides but with the greatly improved pharmacokinetic profiles needed for drug activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytomodulating lipophilic oligopeptide; immune system; inflammation; cytotoxic; lymphocytic; inhibition; cytokine; autoimmune disease; T (B cell; mononuclear phagocyte; septic shock; rheumatoid arthritis; Crohn's disease; colitis; allergy; transplant.

AAY06009
    AAW82804 to AAW82829 are cytomodulating lipophilic oligopeptides. The cligopeptides are used to inhibit: (1) activity of lymphocytes (particularly cytotoxic T cells, but also natural killers, B cells and monounclear phagocytes); (ii) production of inflammatory cytokines, and (iii) an inflammatory response in mammals (e.g. in cases of septic shock, rheumatory arthritis (RA), Crohn's disease, colitis and allergy). They are also used for modulating activity of haem-containing enzymes and for delaying onset of autoimmune disease (specifically insulin-dependent diabetes mellitus, RA and systemic lupus erythematosus). In all cases the oligopeptides may be generated from nucleic acids, and treatments are in vitro or in vivo. A specific application is treatment of organs or cells for transplantation, or of the recipient of such treansplants. Apart from therapeutic use, the oligopeptides can be used to study mechanisms of T cell (de)activation and to raise antibodies that are competitors of the oligopeptides. The oligopeptides are administered by bolus injection or infusion, typically at 0.1-50 (preferably 1-25)
                                                                   New lipophilic peptide(s) that inhibit activation of immune system cells - used for, e.q. production of cytokine(s) and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NY ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human; leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; lung cancer; metastasis; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer; liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy; vaccine; human leukocyte antigen; HLA.

coren for epitopes from the coding replan of human ESO-1/CAG-3

ORF1 (see AAX5859). 30 Epitopes (see AAV5988-Y06017) were identified.

The present peptide (ranked 12) corresponds to amino acid residues

152-161 of CAG-1 ORF1 (see AAY05965). CAG-1 is a new and potent
tumour antigen capable of eliciting an antigen specific immune
crasponse by T (cells. Cancer peptides (see AAV05967-87) derived from
CAG-3, portions of CAG-3 and their variants, are useful as cancer
vaccines. A claimed method of preventing or inhibiting cancer
involves administering a cancer peptide, with or without an HiA
molecule. The cancer peptides form part of, or are derived
from, cancers such as primary or metastatic melanoma, thymoma,
C momble of the cancer peptides form part of, or are derived
crack, cervical cancer, bladder cancer, leukaemia, uterine
cancer, cervical cancer, bladder cancer kidney cancer and
adenocarcinomas such as breast, prostate, ovarian, pancreatic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; lung cancer; netastasis; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer; liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy;

This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 ORF1 (see AAX5859). 30 Epitopes (see AAX5898-Y06017) were identified. The present peptide (ranked 22) corresponds to amino acid residues 154-163 of CAG-1 ORF1 (see AAX05965). CAG-1 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAX05967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NY ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human; leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; lung cancer; metastasis; melanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer; liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy;
                                                                                                                                                                                                                                                                                                                involves administering a cancer peptide, with or without an Hish molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastetic melanoma, lympoma, lymphoma, sarcoma, lung rancer, luver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human cancer antigen NY ESO-1/CAG-3 HLA peptide motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                00000

This peptide was identified as an HLA peptide motif following a screen for epitopes from the coding region of human ESO-1/CAG-3 coren for epitopes (see AAY0598-706017) were identified.

CORFI (see AAX5859) 30 Epitopes (see AAY0598-706017) were identified.

The present peptide (ranked 10) corresponds to amino acid residues to manno acid residues and the present peptide (ranked 10) carresponds to amino acid residues (see AAY05965).

CAG-1 ORFI (see AAY05965). CAG-1 is a new and potent tumour antigien capable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAY05967-87) derived from cag-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived concerts such as primary or metastatic melanoma, thymoma, important or lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, liver cancer, kidney cancer and cancer acid cancer, prostate, ovarian, pancreatic and

hormone receptor function. The methods use a sensor peptide covalently coupled to a detectable label, that provides direct, in vitro ligand-dependent binding to a nuclear hormone receptor. Panels of predetermined or randomized candidate sensors are readily screened for receptor binding. The methods and compositions provide for efficient screening of modulators of nuclear hormone receptor function, without the use of cell- or gel-based steps. The methods are amenable to automated, cost-effective high throughput screening of chemical libraries for bloactive compounds. To ensure specificity and optimize binding, the sensor is generally present at sub-micromolar concentration and the binding reaction occurs in solution. The sensor peptide obviates the need to include a natural coactivator protein of the receptor in the mixture. Sequences having the examples of sensor peptides that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bacteria; fungi; yeast; protozoa; virus; mycoplasma; filaria; plasmodia;

chemical coupling. Such are produced from bovine or human milk by treatment for 2 hr with proceases, then centrifuging to remove fat and aciditying to PH 2 to precipiate proteins. The solution phase is then subjected to reverse-phase high-performance liquid chromatography (HPLC) and cation-exchange HPLC, the fractions adjusted to salt content below to 55 mM (by dialysis or reverse-phase HPLC) and tested for activity by growing Bifidobacterium bifidus and Escherichia coli in pregence of the fractions. Those fractions for which (Bw-B0)-(Ew-EO) is at least 0.15 are selected where Bw = germ count after 16 hr culture of B. Difidus in 50 Biliker broth containing peptide at 0.2 mg/ml, BO = germ count after 16 hr culture of B. Difidus in 20 Biliker broth containing peptide free control. Ew = germ count after 16 hr culture of B. Difidus in 20 mg/ml, EO = germ count under similar conditions in a peptide-free control. The peptides AAW93865-W93888 are used to treat microbe-related diseases caused by bacteria, fundi, yeast, protozoa, viruses, mycoplasma, fillaria and plasmodia, eq. infections, inflammation, microbially induced tumours or degenerative disorders, diarrhoea, collc, abnormalities in oral, intestinal or vaginal microflora, or carles.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genomic sequences of tumour associated antigen EY-ESO-1 (LAGE-2) useful for diagnosing testicular tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAG67169-AAG67206 represent peptides which are derived from cancer testis tumour antigen NY-ESO-1 (also called LAGE-2). The peptides bind to human leukocyte antigens (HLAA). NY-ESO-1 is a molecule that is processed to at least one human leukocyte antigen (HLA) binding peptide, which binds to Class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of cancer, especially testis tumours.
           serovar I, serovar J, serovar K, and serovar LJ, and to DNA sequences encoding them. The peptides are useful in diagnostic tests for C trachomatis infections, serological tests for serotyping, and as subunit vaccines.
 serovar Ba, serovar D, serovar E, serovar F, serovar G, serovar H,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cancer testis tumour antigen NY-ESO-1 derived peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10

                                                                                                                                                                                         NAME/KET: PEPTIDE

LOCATION: (1)..(14)

COTHER INFORMATION: Internal peptide of human GP88 used to develop

COTHER INFORMATION: neutralizing anti-human GP88 monoclonal antibody.
US-09-824-807-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 195, Application US/09826290

Sequence 5, Application US/09824807

Patent No. US20020094966A1

GENERAL INFORMATION:

APPLICART: Seriero, Ginette

TITLE OF INVENTION: BERNA TUMORIGENIC GROWTH FACTOR AND ANTAGONISTS

TITLE OF INVENTION: L. S9996.488/P001-A

CURRENT APPLICATION NUMBER: US/09/824,807

CURRENT ALING DATE: 2001-04-04

PRIOR FILING DATE: 1997-12-16

PRIOR FILING DATE: 1997-12-16

PRIOR FILING DATE: 1997-05-23

NUMBER OF SEQ ID NOS: 17
                                                                                                                                     FEATURE:
| NAME/KEY: PETIDE | COATION: (1)...(14) | COATION: (1)...(14) | OTHER INFORMATION: Internal peptide of mouse GP88 used to raise the OTHER INFORMATION: antisera against the GP88 used in the OTHER INFORMATION: immunoaffinity step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FEATURE:
NAME/KEY: PEPTIDE
LOCATION: (1)...(14)
OTHER INFORMATION: Internal peptide of mouse GP88 used to raise the OTHER INFORMATION: antisera against the GP88 used in the USHER INFORMATION: immunoaffinity step.
